

# WHAT WE LOOK FOR DURING A HEALTHY HOME EVALUATION

At Healthy Home Energy & Consulting, we recommend starting every home performance upgrade with a Healthy Home Evaluation to discover your home's inefficiencies and maximize your energy savings. Here's are a few of the most important points of our energy audit process:

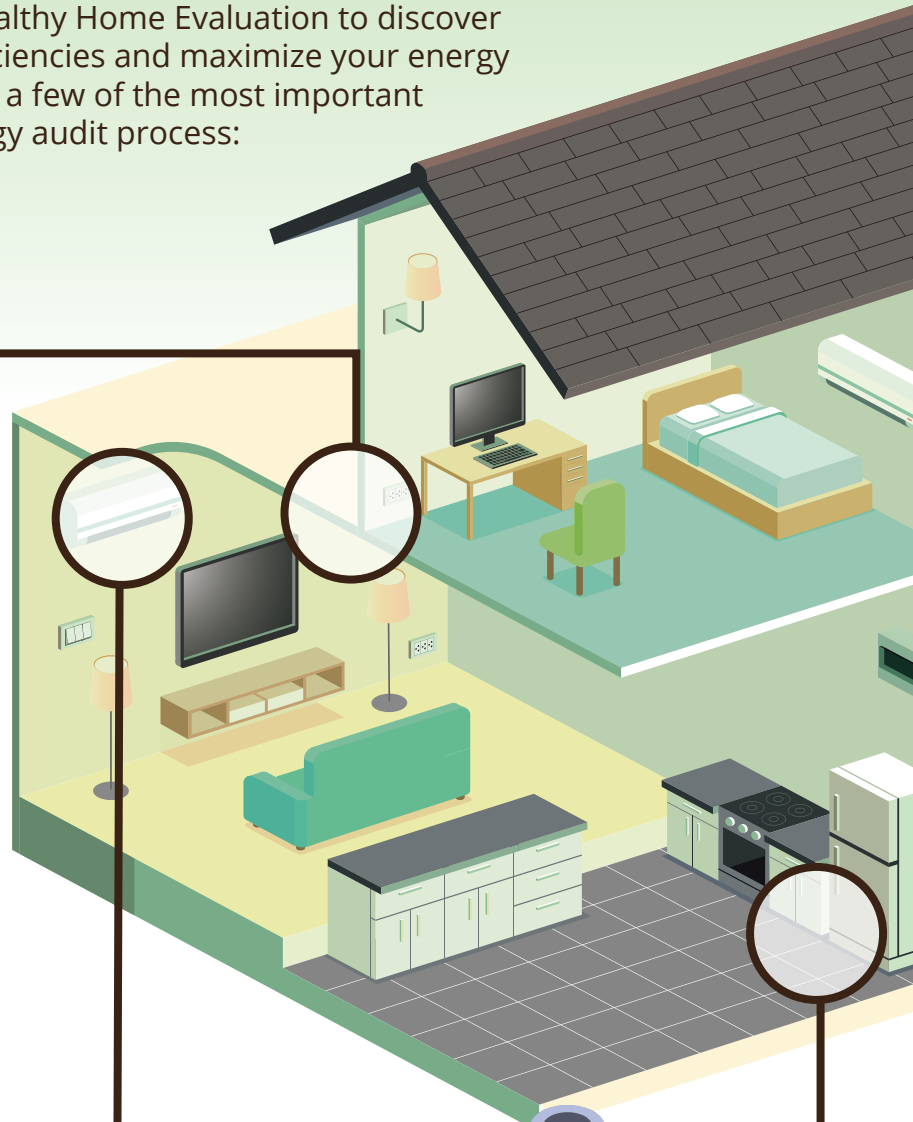

## Air Leaks & Insulation Quality

Underinsulated homes with significant air leaks are prone to comfort and indoor air quality issues. With insulation and air sealing working together to combat energy loss and provide air quality solutions, your home will see the benefits immediately.

## Efficiency of Your Heating & Cooling Systems

The team at Healthy Home Energy & Consulting takes your safety seriously and always performs a combustion test during our evaluations. We also check for the performance of your HVAC and if it's time to consider a replacement for a high-efficiency system, like a heat pump.

## Moisture Intrusion & Mold Growth

Not only do we check for mold growth, we also look for sources of potential mold growth in the future. The best way to prevent mold growth is to eliminate areas of excess moisture and high humidity, like your attic, basement, or crawl space.

## Healthy Homes Start Here

Having a better understanding of your home equips you to finding the best services to improve your efficiency, comfort, and home health. Call the team at Healthy Home Energy & Consulting to take the first step towards whole home solutions today.
